

MEDDPICC Deal-Scoring Framework

How committed deals get scored, flagged, and made **defensible line by line**: the rubric behind the Intelligent Forecast workflow. Every signal is deterministic and built only from the deal's own CRM fields.

ANONYMIZED SAMPLE

Tune to your motion

Two scoring layers run against every committed deal: **qualification depth** (MEDDPICC) and **deal hygiene** (behavioral signals in the record). Each fires a binary flag with a fixed owner. The model explains and drafts the next step; a human confirms anything that moves the number.

LAYER 1 · MEDDPICC QUALIFICATION SIGNALS

ELEMENT	WHAT "HEALTHY" LOOKS LIKE	RISK FLAG FIRES WHEN	WEIGHT
Metrics M	Quantified business case tied to the buyer's KPIs; ROI validated with them	No quantified value, or the number was never confirmed by the buyer	High
Economic buyer E	EB identified, engaged, and has met the team	EB unknown or unengaged past mid-stage	High
Decision criteria D	Documented, and we shaped them	Criteria vague, or authored around a competitor's strengths	Med
Decision process D	Steps, dates, and stakeholders mapped	No clear process; "they'll get back to us"	High
Paper process P	Legal / procurement / security path known and started	Paper process still unknown at late stage	Med*
Identify pain I	Compelling event with a deadline and a cost of inaction	"Nice to have"; no compelling event or date	High
Champion C	Tested champion who sells internally when you're not in the room	No champion, or single-threaded to a passive coach	High
Competition C	Position known; differentiation has landed	Active displacement risk left unaddressed	Med

* Paper-process weight escalates to High inside the closing window.

LAYER 2 · DEAL-HYGIENE SIGNALS (REGION-AWARE)

Stage age vs region norm	In-stage longer than its own region's normal duration, not a global average	Activity recency	No meaningful buyer activity in the last N days
Next step defined	No future-dated next step on the record	Single-threading	One contact only; no multi-threaded engagement
Close-date integrity	Close date pushed twice or more, or already in the past	Amount vs stage	Large amount still early-stage near period end

ROLL-UP · FROM SIGNALS TO A RISK TIER

● **RED · AT RISK**

A committed deal carrying multiple high-weight flags. Surfaced to the forecast call with the reasons attached.

● **AMBER · WATCH**

Isolated or medium-weight flags. Rep owns the fix; tracked but not haircut.

● **GREEN · CLEAN**

No flags fired against the region-normalized thresholds. Counts at full confidence.

- **Region-aware normalization.** Durations and thresholds compare each deal to its region's norm, so EMEA's longer proposals aren't over-flagged and NA's fast-region stalls aren't missed.
- **Deterministic and binary.** Every flag either fires or it doesn't, from the deal's own values: no probabilistic black box on a number the CFO has to defend.

THE RULE THAT KEEPS IT AUDITABLE

Every flag maps **1:1** to a signal on this page, and every threshold lives in config. The model only explains why a flag fired and drafts the next step; **it never sets or clears a flag**. A manager can verify any flag against the CRM in seconds, which is exactly what makes the forecast defensible to the board. Money, comp, and customer decisions stay human-approved by policy.
